Applying the boundary conditions gives, $0 = y(0) = c_1 \cdot 0 = y(2\pi) = c_2 \sin(2\sqrt{3}\pi) \Rightarrow c_2 = 0 = y(0) = c_1 \cdot 0 = y(2\pi) = c_2 \sin(2\sqrt{3}\pi) \Rightarrow c_2 = 0$. In this case we found both constants to be zero and so the solution is, $y(x) = 0 \cdot y(x) = 0$. In the previous example the solution was $y(x) = 0 \cdot y(x) = 0$.

In mathematics, in the field of differential equations, a boundary value problem is a differential equation together with a set of additional constraints, called the boundary conditions. A solution to a boundary value problem is a solution to the differential equation which also satisfies the boundary conditions. Boundary value problems arise in several branches of physics as any physical differential equation will have them. Problems involving the wave equation, such as the determination of our

Equations (2.1b) and (2.2b) are called boundary conditions (BCs) since information is provided at the ends of the interval, i.e., $a \leq x \leq b$. The conditions (2.1b) and (2.2b) are called nonseparated BCs since they can involve a combination of information at $x=a$ and $x=b$.

In this section we go through the complete separation of variables process, including solving the two ordinary differential equations the process generates. We will do this by solving the heat equation with three different sets of boundary conditions. Included is an example solving the heat equation on a bar of length L, but instead on a thin circular ring.
