In thermodynamics, the specific volume of a substance (symbol: v or ν) is an intrinsic property of the substance, defined as the ratio of the substance's volume (V) to its mass (m).It is the reciprocal of density and it is related to the molar volume and molar mass: $v = \frac{V}{m} = \frac{V}{nM} = \frac{V_m}{M}$ ~ The standard unit of specific volume is cubic meters per kilogram (m^3/kg), but other units include ft^3/lb , ft^3/slug ...

Chemistry and physics equations commonly include "R", which is the symbol for the gas constant, molar gas constant, ideal gas constant, or universal gas constant.

Chemistry Definition of Gas Constant (R)

An Otto cycle is an idealized thermodynamic cycle that describes the functioning of a typical spark ignition piston engine.It is the thermodynamic cycle most commonly found in automobile engines. The Otto cycle is a description of what happens to a mass of gas as it is subjected to changes of pressure, temperature, volume, addition of heat, and removal of heat.
