Software-defined networking (SDN) is an approach to networking that uses software-based controllers or application programming interfaces (APIs) to direct traffic on the network and communicate with the underlying hardware infrastructure. This is different from traditional networks, which use dedicated hardware devices (routers and

What SDN does is view cloud-based services as just more network devices. So when you program how an application should be handled, that control will follow the program out to the cloud, or back to your local network, or wherever your devices exist. The other major reason is user programmability.
