The researchers in Aerodynamics know that there is not a unitary method of investigation in this field. The first mathematical model of the air plane wing, the model meaning the integral equation governing the phe nomenon, was proposed by L. Prandtl in 1918.

Most of the early efforts in aerodynamics were directed toward achieving heavier-than-air flight, which was first demonstrated by Otto Lilienthal in 1891. Since then, the use of aerodynamics through mathematical analysis, empirical approximations, wind tunnel experimentation, and computer simulations has formed a rational basis for the development of heavier-than-air flight and a number of other technologies.

A First Course on Aerodynamics is designed to introduce the basics of aerodynamics to the unfamiliar reader. This text avoids lengthy and complicated derivations, focusing on primary equations and fundamental concepts. Detailed figures and explanations of important mathematical equations are interspersed throughout the text.

In 1997 Andy Green was the first to break the sound barrier in his car Thrust SSC, which reached speeds of over 760mph. Now he and his team want to push things even further with a car called Bloodhound, designed to reach the dizzy heights of 1,000mph, about 1.3 times the speed of sound. Ben Evans explains how maths is used to build this car.

As early as second grade, girls have internalized the idea that math is not for them. It can be a challenge to overcome the socially acceptable thought I'm not good at math, says Sarah Bax, a math teacher at Hardy Middle School in Washington, D.C. Rather than being born with or without math talent, kids need to hear from teachers that anyone who works hard can succeed.

Welcome to the Beginner's Guide to Propulsion: What is propulsion? The word is derived from two Latin words: pro meaning before or forwards and pellere meaning to drive. Propulsion means to push forward or drive an object forward. A propulsion system is a machine that produces thrust to push an object forward. On airplanes, thrust is usually generated through some application of Newton's third ...

Lagrange and Laplace were the first to advance the view that the constants which describe the motion of a planet around the Sun are "perturbed", as it were, by the motion of other planets and vary as a function of time; hence the name "perturbation theory".

A quantitative understanding of the sources of all such sounds can be obtained by careful analysis of the mechanical equations of motion. This is provided by Acoustics and Aerodynamic Sound, which serves as a short, one semester introduction to acoustics and aerodynamic sound at the advanced undergraduate and graduate level.

By using a mathematical technique called dimensional analysis, engineers create a model that will accurately reflect the traits of the full-size vehicle. If the tests show that the drag force is adequately small, then the new aerodynamic design is ready to be manufactured!

Starting from a basic knowledge of mathematics and mechanics gained in standard foundation classes, Theory of Lift: Introductory Computational Aerodynamics in MATLAB/Octave takes the reader conceptually through from the fundamental mechanics of lift to the stage of actually being able to make practical calculations and predictions of the coefficient of lift for realistic wing profile and planform geometries.

“Fluid-dynamics”. Aerodynamics is a science (part of “fluid dynamics” field) that studies the flow of a gas (mainly air) interacting with a solid body. It is defined “external” if it analyzes the flows around solid bodies (in the aeronautical and automotive fields, but also in civil engineering with the study of the wind on bridges or large buildings), while “internal” if it ...

The particle swarm optimization (PSO) algorithm has been widely used in aerodynamic optimization because of its excellent optimal-searching ability [22 - 24]. Khurana et al. built an adaptive mutation-PSO (AM-PSO) method in use for redesigning airfoil at flight envelopes encompassing low-to-high Mach numbers [25].
