Computational complexity theory focuses on classifying computational problems according to their resource usage, and relating these classes to each other. A computational problem is a task solved by a computer. A computation problem is solvable by mechanical application of mathematical steps, such as an algorithm.. A problem is regarded as inherently difficult if its solution requires ...

Foundations of mathematics is the study of the philosophical and logical and/or algorithmic basis of mathematics, or, in a broader sense, the mathematical investigation of what underlies the philosophical theories concerning the nature of mathematics. In this latter sense, the distinction between foundations of mathematics and philosophy of mathematics turns out to be quite vague.

Data Science is often viewed as the confluence of (1) Computer and Information Sciences (2) Statistical Sciences, and (3) Domain Expertise. These three pillars are not symmetric: the first two together represent the core methodologies and the techniques used in Data Science, while the third pillar is the application domain to which this methodology is applied.

The standard was primarily designed for thermal comfort in spaces where occupants are in sedentary states (i.e., office work). However, it can also be employed to cover other types of indoor environments, excluding extreme conditions that can be found in ISO 7243, ISO 7933, and ISO/TR 11079. This standard is based upon four pillars:

The mode of a set of data values is the value that appears most often. It is the value at which the data is most likely to be sampled. A mode of a continuous probability distribution is often considered to be any value  $x$  at which its probability density function has a local maximum value, so any peak is a mode. Python is very robust when it comes to statistics and working with a set of a large ...
